## Getting round the city

The grid below represents a city laid out in "blocks" with all the roads running north-south, or east-west.

The red line shows three ways of getting from A to B.
What interesting mathematical questions can you think of to explore on a city grid like this one?

Turn over to see some ideas of questions you might like to explore.

How many different paths are there from $A$ to $B$ ?
If I know the coordinates of two points, can I quickly work out how far I will have to walk to get from one to the other?

Is there a quick way to find all the different paths from one point to another?
Is there a quick way to work out how many different paths there will be?

If I start at a point and only want to walk 6 blocks, how many possible places might I end up?
