

claire

Looking Good!

$$2 = \frac{1}{10}$$

$$3 = \frac{3}{10}$$

$$4 = \frac{4}{5}$$

$$5 = \frac{1}{2}$$

$$6 = \frac{3}{10}$$

$$8 = \frac{2}{5}$$

$$9 = \frac{9}{10}$$

$$10 = \frac{1}{2}$$

$$20 = \frac{20}{20}$$

$$5+5+5+5=20$$

$$\frac{1}{4} + \frac{1}{4} + \frac{1}{4} + \frac{1}{4} = \frac{1}{1}$$

$$4+4+4+4+4=20$$

$$\frac{1}{5} + \frac{1}{5} + \frac{1}{5} + \frac{1}{5} + \frac{1}{5} = \frac{1}{1}$$

$$10+10=20$$

$$\frac{1}{2} + \frac{1}{2} = \frac{1}{1}$$

$$2+2+2+2+2+2+2+2+2+2=20$$

$$\frac{1}{10} + \frac{1}{10} + \frac{1}{10} + \frac{1}{10} + \frac{1}{10} + \frac{1}{10} + \frac{1}{10} + \frac{1}{10} + \frac{1}{10} + \frac{1}{10} = \frac{10}{10}$$

- First I thought well, multiplication is basically repeated addition, so the multiples of twenty would be the easiest. $5 \times 4 = 20$, so $5+5+5+5=20$. I did that for all of the multiples of twenty.

$$6+4+6+4=20$$

$$\frac{3}{10} + \frac{2}{10} + \frac{3}{10} + \frac{2}{10} = \frac{10}{10}$$

$$8+2+8+2=20$$

$$\frac{4}{10} + \frac{1}{10} + \frac{4}{10} + \frac{1}{10} = \frac{10}{10}$$

- My second thought was all the easy ways to make ten - $6+4$, $8+2$, and so on. So, I did $6+4+6+4$ and $8+2+8+2$ and it worked.

$$5+5+6+4=20$$

$$\frac{2}{10} + \frac{2}{10} + \frac{1}{4} + \frac{1}{4} = \frac{10}{10}$$

- My final thought was to mix everything up, so I did $5+5+6+4$ and so $5+5=10$ and $6+4=10$, so, $5+5+6+4=20$.
