

Our initial approach to this problem was using the trial-and-error method. We had previously cut all of the squares out and were trying to match up the first pairs we could see. After a while, we realised that most of the problems could not just be seen initially, and needed some working out to be able to be paired up. This was when we decided to start simplifying the problems that were not already in their simplest forms, and thereafter wrote them on their designated card. This allowed us to, in a much quicker and easier way, match the cards up with a designated pair. After all of the cards had a pair, we started connecting the pairs to another, which quite quickly allowed us to form all four of the donuts.
